

As part of its commitment to provide passengers with the best services, enhance its security system and save passengers time, Queen Alia International Airport (QAIA) has started using the 'L3 Provision 2', one of the most advanced passenger screening systems currently in use at more than 250 international airports.

The system quickly scans passengers for metallic and non-metallic objects, such as explosives and liquids. It causes no side effects as it uses safe millimeter radio wave technology, and no X-rays or any ionizing radiation.

The passenger experience with the 'L3 Provision 2' is convenient, straightforward and efficient, requiring only a single stationary position during a 1.5-second scan. A generic figure resembling a human outline will appear highlighting any present threats. The efficient system reduces the need for traditional pat-downs.
